

Write a Python program to calculate the area of a rectangle given its length and width.

Create a program that takes a user's name and age as input and prints a greeting message.

Write a program to check if a number is even or odd.

Create a Python function to check if a given string is a palindrome.

Calculate the compound interest for a given principal amount, interest rate, and time period.

Implement a program that swaps the values of two variables.

Given a list of numbers, find the sum and average.

Create a program that takes a temperature in Celsius and converts it to Kelvin.

Implement a program that checks if a given string is a palindrome.

Create a function to reverse a given string.

Given a list of names, concatenate them into a single string separated by spaces.

Create a program that takes a year as input and checks if it is a leap year or not.

Given a list of integers, find all the even numbers and store them in a new list.

Calculate the sum of digits of a given number.

Implement a function that returns the factorial of a given number using recursion.

Create a function to find the square of each element in a given list.

Given a list of words, find the word with the maximum length and its length.

Write a Python program to count the occurrences of each element in a given list.

Create a class to represent a Student with attributes like name, age, and grades.

Implement a program that simulates a basic bank account using a BankAccount class.

Write a Python program that uses a Rectangle class to calculate the area and perimeter of a rectangle.

Create a class to represent a Car with attributes like make, model, and year.

Write a program that will tell whether the given number is divisible by 3 & 6.
